

As this opening is for QA/BA role, we have given you two assignment, the first assignment is to assess QA skills and the second assignment is to assess BA skills. Assignment 1 (QA)

Note: Only implement negative scenarios as this is a live site, **skip filling up and submitting the form (apply now option).**

Automation test cases for user flow of careers page in Hexad web site (<https://hexad.de/en/home.html>). Please refer below guidelines:

- Test cases should cover all positive & negative scenarios.
- You have two full days to implement a solution.
- We are really, really interested in your clean code skills, so please solve the problem keeping this in mind.
- Please ensure that the coding conventions, directory structure and build approach of your project follow the conventions set by popular open source projects in the language that you're using.
- You can choose any tech stack for the assignment. However, please provide the justification and documentation to execute the assignment.
- Please use Git for version control so that we can look at your commit logs and understand how your solution evolved. Frequent commits are a huge plus.
- Please do not check in class files, jars or other libraries or output from the build process. Use standard build automation and dependency system like gradle/maven.

Design a **Market place**: a platform to buy and sale of used products.

Need to consider the below questions:

- How would you measure the success to reach the objective?
- What data would you capture?
- How would you break down and organize work into a roadmap?
- How would you define work and collaborate with the design and development team?
- What would be your top 5 stories?
